
Fatal error: require_once()

Posted by admin - 2007/10/23 20:16

If you see an error like this when the user tries to subscribe:

```
Fatal error: require_once() : Failed opening required '/your/php/path/config/config.php'
(include_path=.;\xxx\xxx\php\pear\) in
\your\joomla\path\modules\mod_jlord_phplistsubscriber\jlord_phplistsubscriber_underground.php on line 84
```

This is because the absolute URL you specified is not correct! and the module is not able to read your phplist configuration file!

Correct the absolute path and try again!

=====

The absolute path is the location of your phplist installation in your web server. It should be something similar to the location path found in your Joomla Global Configuration:

Site Menu > Global Configuration > Server Tab > Absolute path.

Go into your web server Control Panel and find out where your phplist is installed.

Good luck,

=====

Go into your web server Control Panel and find out where your phplist is installed.

Good luck,

I have installed PHPList Registration and PhPList Suscriber Module now

I got trouble too with getting it to work ...what you mean by...

your phplist is installed

...where my PHPList Registration Component is installed ??

or do i need to install PHPList?? ...if so !! How do i do that?? ...can I do that though Joomla??
